

## **Advice to Registrants from Fitness to Practise Case 17/01**

- The RCT Professional Conduct Committee (PCC) wants to help all Registrants to work within the Code of Professional Conduct of the RCT and to protect the safety of patients and the public at all times.
- To assist Registrants, we identify the learning points from Fitness to Practise cases that come before PCC Panels and make these available through the RCT website and the Registrar's Update sent to all registrants.
- Registrants should also read the Registrar's Update, the Code of Professional Conduct and the policies available on the RCT website to help them maintain safe practice.

### Learning points from Case 17/01:

- The case involved a registrant who had provided an incorrect and potentially harmful dose of radioactive isotope to a patient. The registrant did not inform anyone of the presumed error once she was aware of it and incorrectly recorded the dose in the record.
- The registrant was not familiar with the employer's procedure for checking dosages and did not consult a senior colleague.

### Learning point 1:

- Make sure you are familiar with your employer's procedures for dose checking and administration. If you cannot recall a procedure then consult the document before starting to administer the dose.

### Learning point 2:

- If you make an error, always report it immediately to the appropriate person so that the situation can be assessed and remedial action can be taken as necessary – the safety of the patient/public is the most important consideration.
